| Background | NKP30 is a natural killer cell receptor, belonging to the NCR family. It plays a crucial role in natural killer cells (NK cells) by interacting with ligands on the surface of tumor cells, participating in the regulation of NK cell activation and cytotoxicity. Research on NKP30 can help us gain a deeper understanding of the immune regulation mechanisms of NK cells and their potential applications in tumor immunotherapy. In cancer immunotherapy research, the activation of NKP30 can enhance the killing of tumor cells by NK cells, making it a promising target for future cancer treatments. |
