**Description** CDCP1 (CD318) is a transmembrane glycoprotein broadly expressed on

epithelial cells in skin, adrenal glands, and intestines, plus some blood cells and tumors. It features a long extracellular domain, a single transmembrane segment, and a short cytoplasmic tail. CDCP1 participates in adhesion, migration, signaling, and remodeling, activating pathways like PI3K/Akt and Src to

influence survival and movement.

Clinically, CDCP1 links to cancer progression, especially invasion and metastasis. Its level and activation may serve as a prognostic marker or therapeutic target, possibly by modulating cell-cell and cell-matrix interactions and the tumor microenvironment. Research continues on its upstream regulators, downstream signaling, and therapies such as antibodies, inhibitors, or antibody—

drug conjugates to block its functions.
